

# Chapter 1

## Proofs

### Mathematical Statements

A *mathematical statement* is an English statement that has a truth value.

**Types of Statements** Compound statements, Implications, Double implications, Converse of an Implications, Negations, and Quantifiers.

### Compound Statement ( $P$ and $Q$ )

A *compound statement* is a statement constructed from two statements joined by the words “and” or “or”.

**Example 1.1** (Compound Statement). Let  $x$  be a real number.

$P$  : Then number  $x$  is greater than 3.

$Q$  : Then number  $x$  is even.

$P$  and  $Q$  : The number  $x$  is greater than 3 **and**  $x$  is even.

$P$  and  $Q$  : The number  $x$  is greater than 3 **or**  $x$  is even.

**Question:** What are the truth values of  $P$  and  $Q$  and  $P$  and  $Q$ ?

1. If  $x = 6$ ?  $P$  and  $Q$ ,  $P$  or  $Q$  are true.
2. If  $x = 5$ ?  $P$  and  $Q$  is false.  $P$  or  $Q$  is true.
3. If  $x < 3$ ?  $P$  and  $Q$  is false. ,  $P$  or  $Q$  depends on the value of  $x$ .

**Implication ( $P \rightarrow Q$ )**

The mathematical statement “ $P$  implies  $Q$ ” is an implication where  $P$  is the hypothesis and  $Q$  is the conclusion. Other forms of an implication are “If  $P$  then  $Q$ .”, “ $P \rightarrow Q$ ”, and “ $P \Rightarrow Q$ ”.

**Example 1.2.** If  $x$  is greater than 0, then  $x^2$  is greater than 0. Here “ $x$  is greater than 0” is the hypothesis and “ $x^2$  is greater than 0” is the conclusion.

**Converse of an implication ( $Q \rightarrow P$ )**

The converse of “ $P$  implies  $Q$ ” is “ $Q$  implies  $P$ ”.

**Example 1.3. Converse of previous example**

If  $x^2$  is greater than 0, then  $x$  is greater than 0.
