Chapter 1

Proofs

Mathematical Statements

A mathematical statement is an English statement that has a truth value.

Types of Statements Compound statements, Implications, Double implications, Converse of an Implications, Negations, and Quantifiers.

Compound Statement (P and Q)

A compound statement is a statement constructed from two statements joined be the words "and" or "or".

Example 1.1 (Compound Statement). Let x be a real number.

P: Then number x is greater than 3.

Q: Then number x is even.

P and Q: The number x is greater than 3 and x is even.

P and Q: The number x is greater than 3 or x is even.

Question: What are the truth values of P and Q and P and Q?

- 1. If x = 6? P and Q, P or Q are true.
- 2. If x = 5? P and Q is false. P or Q is true.
- 3. If x < 3? P and Q is false. , P or Q depends on the value of x.

Implication $(P \rightarrow Q)$

The mathematical statement "P implies Q" is an implication where P is the hypothesis and Q is the conclusion. Other forms of an implication are "If P then Q.", " $P \to Q$ ", and " $P \Rightarrow Q$ ".

Example 1.2. If x is greater than 0, then x^2 is greater than 0. Here "x is greater than 0" is the hypothesis and " x^2 is greater than 0" is the conclusion.

Converse of an implication $(Q \to P)$

The converse of " P implies Q" is " Q implies P".

Example 1.3. Converse of previous example

If x^2 is greater than 0, then x is greater than 0.
